

Laboratory Assessment: Reflection

In one short paragraph, how did you develop and verify your solution to one quick activity, and how did organizing and committing your files help you document your work?

- I created my solution by understanding first the requirements that is needed, writing the decomposition, which consists of input, to get the quantity, process, to calculate the subtotal, combined total, and change, output to show the total cost, this help me organize my solution very well, i then proceed to pseudocode to help me understand more the plan of my program on where to start and end. Then, dry run calculations to test if the case 1 logic is correct, find errors, and to manually test how a program works, as well as in case 2. By organizing and committing my files help me to stay clear about my works, and to track my progress and review what i finish.
